

Lecture 2: Basics of Probability Theory

Professor Ilias Bilonis

The sum rule

Motivation of the sum rule

$$p(B_1 + B_2 | I) = 1$$
$$p(B_1 B_2 | I) = 0$$

$$p(A | I) = p(AB_1 | I) + p(AB_2 | I)$$
$$= p(A | B_1, I) p(B_1 | I) + p(A | B_2, I) p(B_2 | I)$$

Example: Drawing balls from a box Without replacement

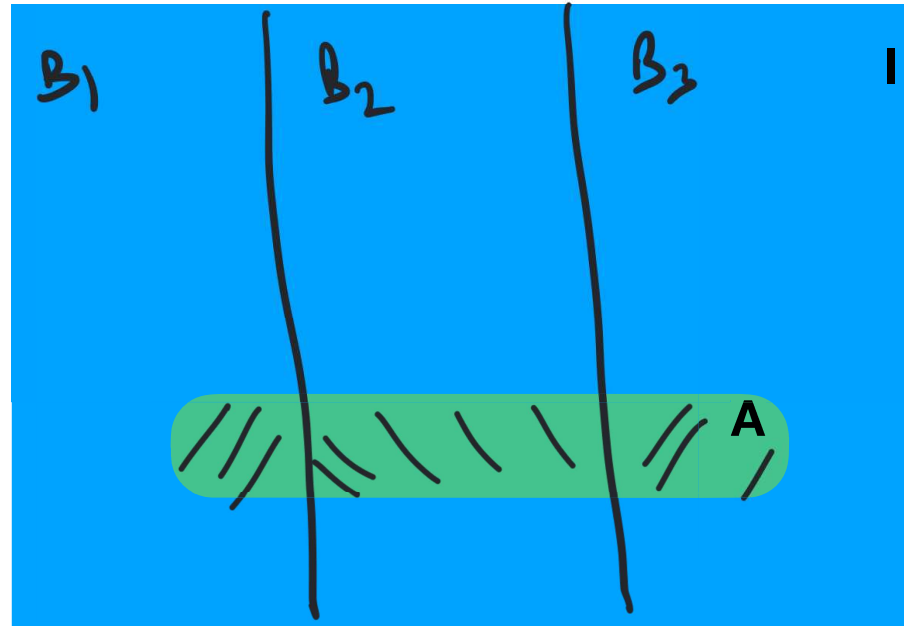

We have found that:

$$\underline{p(B_1 | I)} = \frac{2}{5} \quad \underline{p(R_1 | I)} = \frac{3}{5} \quad \underline{p(R_2 | B_1, I)} = \frac{2}{3} \quad \underline{p(R_2 | R_1, I)} = \frac{5}{9}$$

What is the probability of getting a red ball that the second draw independently of what we got in the first one?

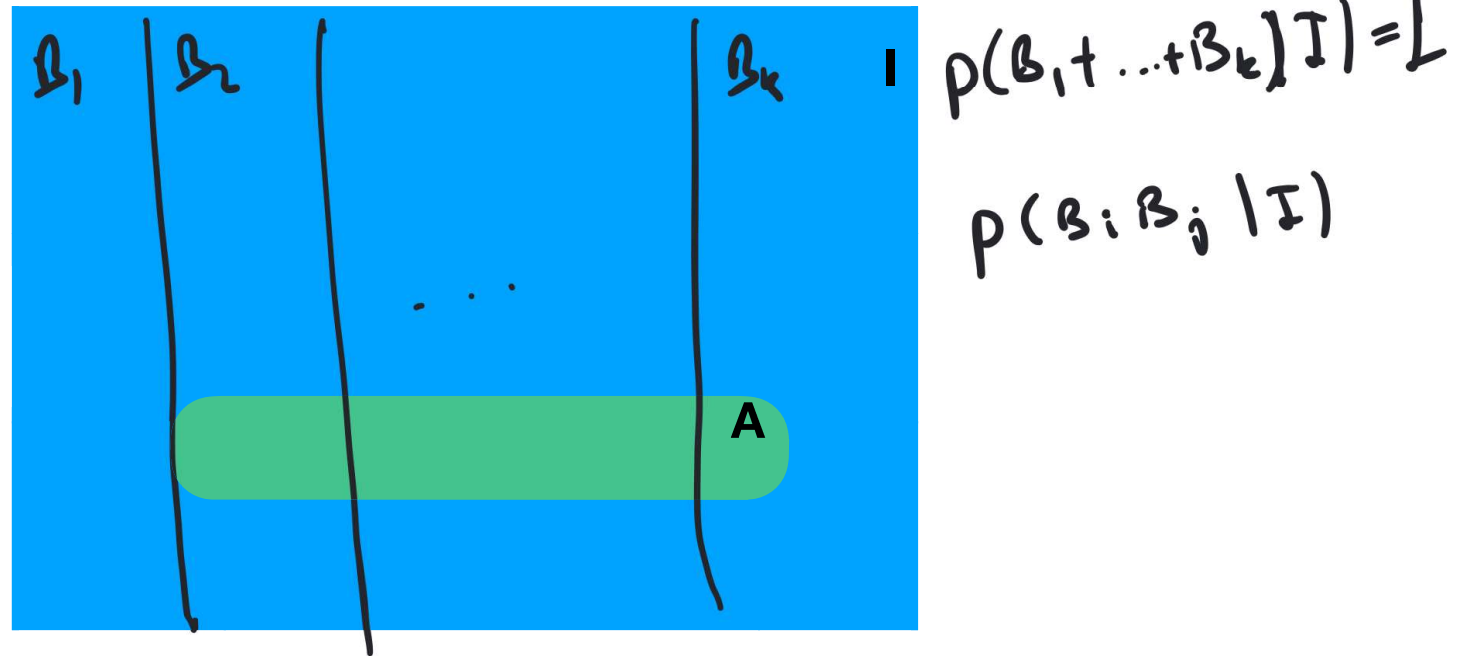

$$\begin{aligned} p(R_2 | I) &= p(R_2 B_1 | I) + p(R_2 R_1 | I) \\ &= p(R_2 | B_1, I) p(B_1 | I) + p(R_2 | R_1, I) p(R_1 | I) \\ &= \frac{2}{3} \cdot \frac{2}{5} + \frac{5}{9} \cdot \frac{3}{5} = \dots \end{aligned}$$

Generalization of the sum rule to three sets

$$\begin{aligned} p(A | I) &= p(AB_1 | I) + p(AB_2 | I) + p(AB_3 | I) \\ &= p(A | B_1, I) p(B_1 | I) + p(A | B_2, I) p(B_2 | I) + \dots \end{aligned}$$

The sum rule

$$p(A | I) =$$
