Lecture 4: Continuous Random Variables

Professor Ilias Bilionis
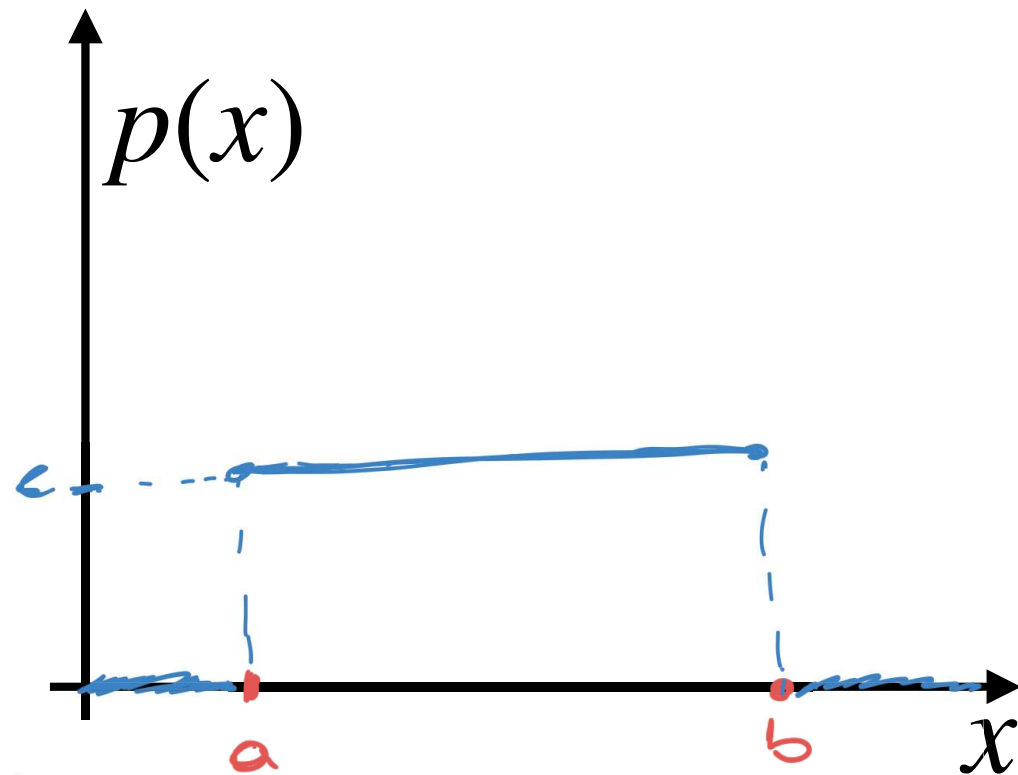

The uniform distribution

The uniform distribution

- Models a random variable that takes values within an interval $[a, b]$ all with equal probability.

- We write:

$$X \sim \mathcal{U}\left([a,b]\right)$$

- The probability density is:

$$p(x) = \begin{cases} c, & x \in [a,b] \\ 0, & \text{otherwise} \end{cases}$$

$$p(x)$$

$$\int_a^b p(x)\,dx = 1 \implies c(b-a) = 1$$

$$\implies c = \frac{1}{b-a}$$
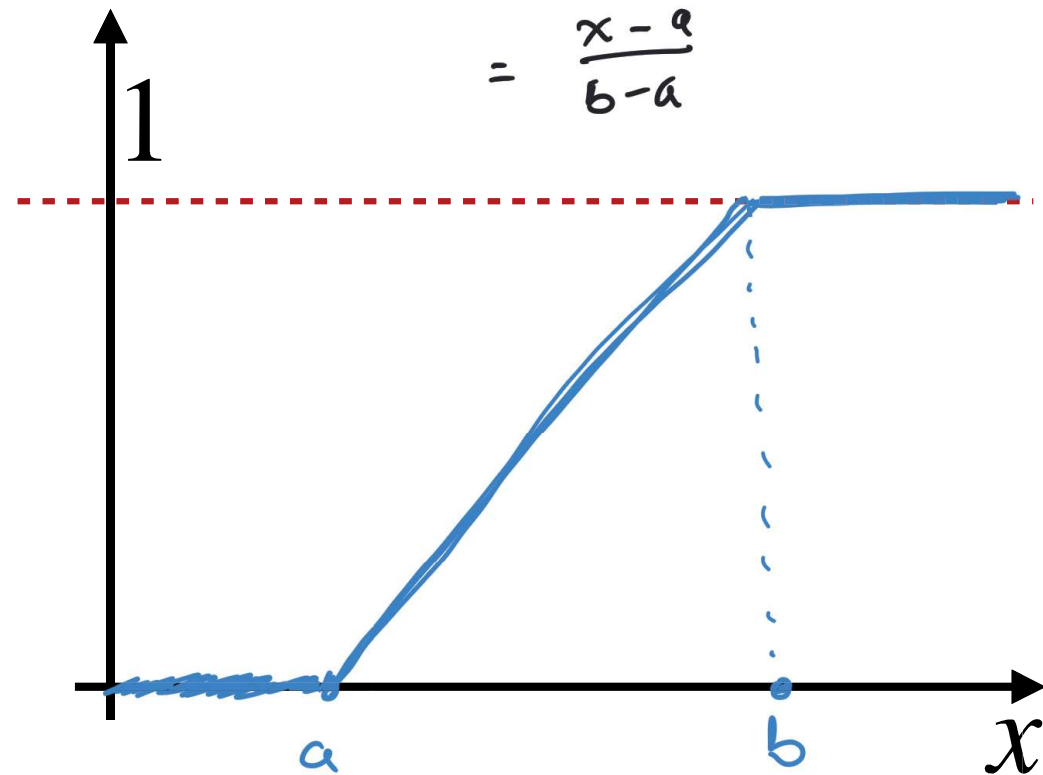

The CDF of the uniform distribution

$$p(x) = F'(x) \Rightarrow F(x) = \int_a^x p(x)\,dx = \int_a^x \frac{1}{b-a}\,dx$$

$$= \frac{x-a}{b-a}$$

- Consider:

$$X \sim U([a,b])$$

- The CDF is:

$$F(x) = \begin{cases} 0 & , \quad \text{if } x < a \\ \frac{x-a}{b-a} & , \quad \text{if } a \le x \le b \\ 1 & , \quad \text{otherwise} \end{cases}$$

The expectation of the uniform distribution

$X \sim U([a, b])$

$$p(x) = \begin{cases} \frac{1}{b-a}, & x \in [a, b] \\ 0, & \text{otherwise} \end{cases}$$

$$\mathbb{E}[X] = \int xp(x)dx = \int_a^b x \frac{1}{b-a} dx = \frac{x^2}{(b-a)2} \Big|_a^b = \frac{a+b}{2}$$

$$\mathbb{E}[X^2] = \int_a^b x^2 p(x)dx = \frac{x^3}{3(b-a)} \Big|_a^b = \cdots$$

$$\mathbb{V}[X] = \mathbb{E}[X^2] - (\mathbb{E}[X])^2 = \frac{(b-a)^2}{12}$$

PREDICTIVE SCIENCE LABORATORY

Example of a uniform random variable

- Take:

$$X = \textbf{mass of} \bullet$$

- You are told that the manufacturer guarantees that the mass is between 9.99 and 10.01 grams?

- If this is all the information we have, we would assign a uniform:

$$X \sim U([9.99, 10.01])$$
